

Waste Disposal *Tips*

You might have seen these bins around. Make sure you're putting your waste in the correct bin with the following tips.

Compost

Most food scraps such as banana peels, apple cores, orange peels, and even noodles and hamburgers can be composted. You can also add soiled UNCOATED paper products like napkins and wood stirrers. If the product has a plastic coating (like a hot beverage cup), it goes to the landfill.

Recycling

The recycling bin is where you can put your EMPTY aluminum cans, glass and plastic containers, coffee cup lids, and cardboard. Make sure your cups and bottles do not have any liquids in them before putting them in the bin.

Landfill

This is where you put anything that doesn't go in any of the other bins such as straws, plastic-lined coffee cups, chip bags, and candy wrappers. If the bin does not have a liquid pour station, pour out your liquids in this bin before recycling your beverage container.

Liquids

Before you recycle your glass/plastic beverage containers or aluminum cans, pour out the the remaining liquid. Some waste bins have a liquid pour station for you to use for this purpose. If there is no liquid pour station, pour your liquid in the landfill bin before recycling your container.
